

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

SOME NEEDED WORK.

Those who imagine that we are nearing the end of bird study—that there is not much left worth spending time upon—should search through all available bird books for such common things as most phases of breeding habits, the problems of song, most questions relating to food and the manner and times of feeding, the effect of light and wear and age upon color of the feathers. In short, there is nothing yet fully known even in the field of the more evident matters relating to the birds. In the less evident, having to do with mental processes, physiological processes and the like almost nothing has been done. Anyone should be able to throw light upon the questions of nest building, deposition of the eggs, period of incubation, young in the nest and out of it, and anything else relating to the life as revealed in the nesting season. There are doubtless more than a dozen species of birds nesting within your reach every year, and yet it is not a hazardous venture that you are ignorant about all of these suggested questions. Ought you to be? Such work will prove intensely interesting and of great value. It must certainly be within the reach of all who live where trees grow. For such work the birds need not be disturbed to the point of leaving the nest in order to carry on the necessary observations. If the nest is too high to be looked into without climbing too near it and where a step-ladder cannot be used, a small mirror on the end of a stick will often suffice. But if the study taxes your ingenuity, so much the better!
